

# GUARDIAN

## Wireless Warehouse System

### Use Wireless Technology to Your Advantage!

- Save time - reduce errors since there is no need to manually key in data.
- Save money - stop wasting time manually entering inventory transactions into the system
- Take advantage of the speed and accuracy of barcode technology.
- Totally online solution - no messy cables and inconvenient download routines.
- Issue, transfer and count warehouse items.
- Seamlessly integrated to **GUARDIAN CMMS**.

### THINK ABOUT IT ...

- How could you reduce the number of costly data-entry errors when issuing parts from inventory?
- Wouldn't it be great if you could improve the efficiency of warehouse personnel when issuing, transferring or counting parts?
- How can you take advantage of handheld wireless devices and barcoding technology to improve your warehouse operations?

### THE SOLUTION ...

The **GUARDIAN Wireless Warehouse System**. This system is made up of a wireless server, antenna, handheld scanner and barcode printer. These work together with **GUARDIAN** to create a fast and efficient way of issuing parts from the warehouse.

There are no cables and no downloading information from the handheld scanner into the **GUARDIAN** database - it all happens automatically online. This means that the data entered into the scanner can be validated as it's entered, significantly reducing or even eliminating data-entry errors. Your inventory also reflects changes as they happen without having to wait to download data.

Wireless Warehouse Technical Diagram

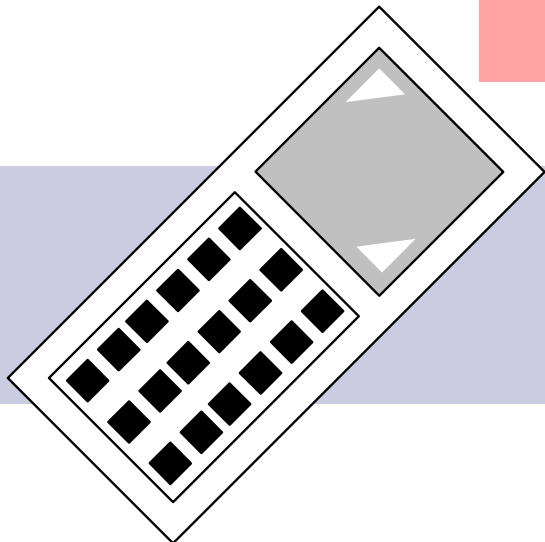

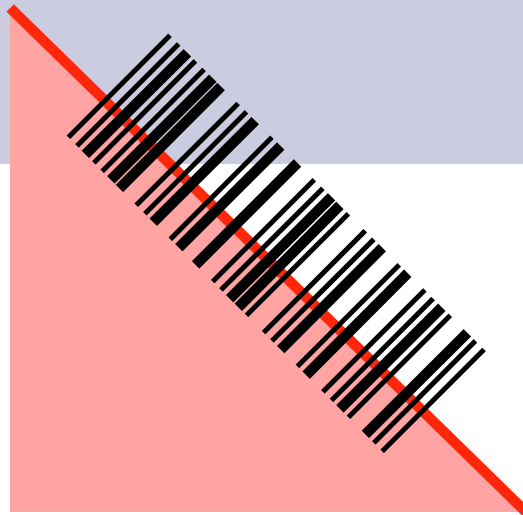

## How Does it Work?

1. Attach barcode labels to bins and parts. Optionally print barcode labels on Work Orders, PM's, Equipment Lists, Material Request Forms and Employee Badges.
2. Choose the Function you wish to perform (Issue Parts, Transfer Parts, Count Parts).
3. Scan the Bin, Part and optionally the Source Document (Work Order, PM, etc.)
4. Key in the quantity and you're done!

## Features and Highlights

- Issue parts to Work Orders, PM's, Material Requests or directly to Equipment.
- Transfer parts from one location to another.
- Count parts - perform random spot checks or detailed inventory counts.
- Reduce data-entry errors by virtually eliminating keyboarding by warehouse personnel.
- All transactions are processed immediately. No downloading from the handheld scanner to the **GUARDIAN** server. Quantity on hand is current up to the minute.
- By printing barcodes on your source documents (Work Orders, PM's, etc.), you can capture all inventory transaction detail associated with the document.
- System security is maintained as all users must logon to the handheld scanner before any transactions can be processed.
- Seamless integration to **GUARDIAN**. All transactions generate all cost records and account transactions for costing within GUARDIAN and integration to third party accounting systems.
